In physics, Langevin equation (named after Paul Langevin) is a stochastic differential equation describing the time evolution of a subset of the degrees of freedom. These degrees of freedom typically are collective (macroscopic) variables changing only slowly in comparison to the other (microscopic) variables of the system.

...

We study homogenization for a class of generalized Langevin equations (GLEs) with state-dependent coefficients and exhibiting multiple time scales. In addition to the small mass limit, we focus on homogenization limits, which involve taking to zero the inertial time scale and, possibly, some of the memory time scales and noise correlation time scales. The latter are meaningful limits for a ...

W. P. Petersen Numerical Methods for Langevin Equations Velocity distributions are given by Fokker-Planck eq. (Spitzer and H"arn, '58), and kicks ψ are typically very small: $\Delta v \approx 2Gm/bv$ and $\Delta v/v \approx \psi \sim 1/N^{2/3}$ where N = number of stars in the system. Langevin equation is equivalent to Fokker-Planck equation.
